Will do Linda, sorry for the oversight. We don't have a formal schedule, but expect to complete the eastern perimeter wells this week, and possibly begin on the northwestern perimeter well Friday. Next week we would finish the NW well and proceed to the landfill wells, as needed. I would expect the field work will wrap up end of next week, or possibly early the following week. Borings completed as permanent wells and added to the monitoring network would be documented in an updated GW system certification and well installation report. We could include logs and discussion of borings that are not completed as wells in the well install report, or separately; we haven't discussed that level of detail yet. Hope this helps!

Jennifer,

Treasure shared the email below with us. Would you please add Kendra Morrison, Stephen Churchill and me to future emails on this project? Thanks.

Also, if you have developed a schedule, would you share that also? Will a report be developed for this fieldwork?

Linda Jacobson

Subject: RE: checking-in

Hi Treasure, I was just in the process of emailing you, when I got interrupted by a call. Yes, that works for me too, and I think the timing will be productive re: field observations. Brief summary below.

I have a call from 9-10 that I am trying to get rescheduled, but if not it would be best to meet before or after that. I could meet you at 8 a.m. if that works?

=====

Here is a brief description of the deeper boring at W-2B. We will name the shallow well at this location W-2A.

W-2B – Deeper Boring at W-2 described below. Temp well screen placed at 38-58' and 2' of bentonite placed above screen to keep the water from weathered bedrock zone out.

0-7 colluvium, dry to 6 ft low moist after 6ft

7-23 clay (very highly weathered shale/shale derived), low moist to moist on fresh breaks

23-34 weathered fractured shale, some highly fractured zones, iron staining, remineralization along fractures, moist.

Stopped drilling at 30' to observe and water came up to 23ft in open borehole.

34-60 strong shale, no natural fractures (fractures induced along bedding planes during drilling). Clayey weak zones (4-6 in) at 38 & 39ft, rock moist on fresh breaks in vicinity. Water decreasing in fresh breaks after about 40ft, dry on fresh breaks after 45.

Another weak clay lens (1in, bentonitic) at 51ft.

Now they are drilling W-2A and will permanently screen from 23-33 feet. No need for temp well because they saw the water here.

How did things go on Friday? It looks like I'll be able to travel to Comanche tomorrow, and would be great to be able to see some core. If that still works for you (and/or Renee), let's try to sort out a good time. I hope all's moving smoothly!
